Program Name: FRONT-END SOFTWARE DEVELOPMENT

Title : List, Tuple and Dictionary

Name: Justin Chong

IC Number: 960327-07-5097

Date : 21/6/2023

Introduction : Learning to read and write data from json files using Python. Also, learning to extract the data from json files and put them into either list, tuple, or dictionary.

Conclusion : A lot more familiarized with the built-in functions to read and write data from json files.

EXERCISE 4

List, Tuple and Dictionary

In [ ]:
```
Note : Please start your jupyter notebook using the anaconda prompt with th
Data Rate Exceeded Problem
At the anaconda prompt, type : jupyter notebook --NotebookApp.iopub_data_ra
```

Question 1

Expected answer:

```
match_ends
3
2
1
```

In [2]:

```
# A. match_ends
# Given a list of strings, return the count of the number of
# strings where the string length is 2 or more and the first
# and last chars of the string are the same.
# Note: python does not have a ++ operator, but += works.

text1 = (['aba', 'xyz', 'aa', 'x', 'bbb']) #3
text2 = (['', 'x', 'xy', 'xyx', 'xx']) #2
text3 = (['aaa', 'be', 'abc', 'hello']) #1

def match_ends(words):
    # your code here

    count = 0
    for i in words:
        if len(i) >= 2 and i[0] == i[-1]:
            count += 1

    return count

print('match_ends')
print(match_ends(text1))
print(match_ends(text2))
print(match_ends(text3))
```

```
match_ends
3
2
1
```

Question 2

Expected answer:

```
front_x
['xaa', 'xzz', 'axx', 'bbb', 'ccc']
['xaa', 'xcc', 'aaa', 'bbb', 'ccc']
['xanadu', 'xyz', 'aardvark', 'apple', 'mix']
```

In [3]:
```
# B. front_x
# Given a list of strings, return a list with the strings
# in sorted order, except group all the strings that begin with 'x' first.
# e.g. ['mix', 'xyz', 'apple', 'xanadu', 'aardvark'] yields
# ['xanadu', 'xyz', 'aardvark', 'apple', 'mix']
# Hint: this can be done by making 2 lists and sorting each of them
# before combining them.

# ['xaa', 'xzz', 'axx', 'bbb', 'ccc']
text1 = (['bbb', 'ccc', 'axx', 'xzz', 'xaa'])

# ['xaa', 'xcc', 'aaa', 'bbb', 'ccc']
text2 = (['ccc', 'bbb', 'aaa', 'xcc', 'xaa'])

# ['xanadu', 'xyz', 'aardvark', 'apple', 'mix']
text3 = (['mix', 'xyz', 'apple', 'xanadu', 'aardvark'])

def front_x(words):
    # your code here

    wordList = sorted([word for word in words if word[0] != 'x'])
    xwordList = sorted([word for word in words if word[0] == 'x'])

    return xwordList + wordList

print()
print('front_x')

print(front_x(text1))
print(front_x(text2))
print(front_x(text3))
```

```
front_x
['xaa', 'xzz', 'axx', 'bbb', 'ccc']
['xaa', 'xcc', 'aaa', 'bbb', 'ccc']
['xanadu', 'xyz', 'aardvark', 'apple', 'mix']
```

Question 3

Expected answer:

```
[(2, 1), (3, 2), (1, 3)]
[(3, 1), (1, 2), (2, 3)]
[(2, 2), (1, 3), (3, 4, 5), (1, 7)]
```

In [4]:

```
# C. sort_last
# Given a list of non-empty tuples, return a list sorted in increasing
# order by the last element in each tuple.
# e.g. [(1, 7), (1, 3), (3, 4, 5), (2, 2)] yields
# [(2, 2), (1, 3), (3, 4, 5), (1, 7)]
# Hint: use a custom key= function to extract the last element form each tu

#output: [(2, 1), (3, 2), (1, 3)]
list1 = [(1, 3), (3, 2), (2, 1)]

#output: [(3, 1), (1, 2), (2, 3)]
list2 = [(2, 3), (1, 2), (3, 1)]

#output: [(2, 2), (1, 3), (3, 4, 5), (1, 7)]
list3 = [(1, 7), (1, 3), (3, 4, 5), (2, 2)]

def sort_last(tuples):
    # your code here

    return sorted(tuples, key = lambda x : x[-1])

print(sort_last(list1))
print(sort_last(list2))
print(sort_last(list3))
```

```
[(2, 1), (3, 2), (1, 3)]
[(3, 1), (1, 2), (2, 3)]
[(2, 2), (1, 3), (3, 4, 5), (1, 7)]
```

Question 4

In [10]:
```
# read the stocks.json file and store into 'records'
import json

%pwd

path ='.././Data Files/stocks.json'

stock_data = []
with open(path) as f:
    for line in f:
        stock_data.append(json.loads(line))

records = stock_data

print(records)
```
